Department of Artificial Intelligence & Data Science

Aim :- Write simple query to manipulate string operations and perform aggregate functions like (MIN, MAX, SUM, AVERAGE, COUNT).

Objective :- To apply aggregate functions and string manipulation functions to perform simple queries in the database system

Theory:

Simple Queries in SQL:

In SQL, a simple query is a request for data from a database table or tables. It allows users to retrieve specific information by specifying the columns they want to retrieve and any conditions for filtering rows based on certain criteria. Simple queries are the backbone of interacting with databases, enabling users to extract the data they need for analysis, reporting, or further processing.

String Manipulation Operations:

String manipulation operations in SQL involve modifying or transforming string values stored in database columns. These operations are crucial for tasks such as formatting data, combining strings, converting case, or extracting substrings. By using string functions and operators, users can manipulate text data to suit their requirements, whether it's for display purposes or for further analysis.

Aggregate Functions:

Aggregate functions in SQL are used to perform calculations on sets of values and return a single result. These functions allow users to summarize data across multiple rows, providing insights into the overall characteristics of the dataset. Common aggregate functions include calculating counts, sums, averages, minimums, and maximums of numerical values. They are essential tools for data analysis, enabling users to derive meaningful insights from large datasets.

Benefits of Understanding These Concepts:

- **Data Retrieval:** Simple queries allow users to fetch specific data from databases, facilitating data retrieval for various purposes.
- **Data Transformation:** String manipulation operations enable users to format and transform text data according to their needs, improving data consistency and readability.
- **Data Analysis:** Aggregate functions help users summarize and analyze large datasets, providing valuable insights into trends, patterns, and statistical measures.
- **Data Reporting:** By combining simple queries, string manipulation operations, and aggregate functions, users can generate reports and visualizations that communicate key findings effectively.

Implementation:

CONCATE:-

```
1 • use hotel_management;  
2 • SELECT CONCAT(First_Name, ' ', Last_Name) AS FullName  
3 • FROM customer;
```

Result Grid		Filter Rows:	Export:	Wrap Cell Content:
FullName				
▶	Piyush Polekar			
	Sara Parave			
	Priya Gharat			

LENGTH:-

```
1 • use hotel_management;  
2 • SELECT char_length(reservation_ID) as reservation from reservation;
```

Result Grid		Filter Rows:	Export:	Wrap Cell Content:
reservation				
▶	9			
	9			
	9			

LOWER:-

```
1 • use hotel_management;  
2 • SELECT LOWER>Last_Name) AS Last_Name  
3 • FROM customer;
```

Result Grid		Filter Rows:	Export:	Wrap Cell Content:
Last_Name				
▶	polekar			
	parave			
	gharat

REPLACE :-

```
1 • use hotel_management;  
2 • SELECT REPLACE(First_Name, 'Piyush', 'Pratham') AS First_Name  
3 FROM Customer;
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
First_Name			
Pratham			
Sara			
Priya			

SUBSTRING :-

```
1 • use hotel_management;  
2 • SELECT substring(Last_Name,1,3) AS First_Name  
3 FROM customer;
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
First_Name			
Pol			
Par			
Gha			

UPPER:-

```
1 • use hotel_management;  
2 • SELECT UPPER(Last_Name) AS Last_Name  
3 FROM customer;
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
Last_Name			
POLEKAR			
PARAVE			
GHARAT			

Conclusion:

1. Write syntax and explanation for each of the five aggregate functions.

a) COUNT():

Syntax: COUNT(expression)

Explanation: Counts the number of rows in a table or the number of non-null values in a specific column. The expression can be either an asterisk * to count all rows, or a specific column name to count non-null values in that column.

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

b) SUM():

Syntax: SUM(expression)

Explanation: Calculates the sum of all values in a numeric column. The expression must reference a numeric column. NULL values are ignored in the calculation.

c) AVG():

Syntax: AVG(expression)

Explanation: Calculates the average (mean) value of all values in a numeric column. The expression must reference a numeric column. NULL values are ignored in the calculation.

d) MIN():

Syntax: MIN(expression)

Explanation: Returns the minimum value in a column. The expression must reference a column containing values that can be compared. NULL values are ignored in the comparison.

e) MAX():

Syntax: MAX(expression)

Explanation: Returns the maximum value in a column. The expression must reference a column containing values that can be compared. NULL values are ignored in the comparison.

2. Show results of operations performed.

COUNT():

```
SELECT COUNT(*) FROM Sales;
```

Result: 5 (Counts all rows in the table)

SUM():

```
SELECT SUM(Quantity) FROM Sales;
```

Result: 55 (Sum of all non-null values in the Quantity column)

AVG():

```
SELECT AVG(Price) FROM Sales;
```

Result: 6 (Average of all non-null values in the Price column)

MIN():

```
SELECT MIN(Price) FROM Sales;
```

Result: 4 (Minimum value in the Price column)

MAX():

```
SELECT MAX(Quantity) FROM Sales;
```

Result: 20 (Maximum value in the Quantity column)
